TA Questions

Question	N	n	SD	D	N	A	SA	N/A	IM	DI
The teaching assistant was well prepared.	26	10	0	0	1	1	7	1	4.9	0.3
The teaching assistant was helpful.	26	10	0	0	1	1	7	1	4.9	0.3
The teaching assistant was considerate of students.	26	10	0	0	1	0	8	1	4.9	0.2
The teaching assistant was easily understood.	26	10	0	0	1	1	7	1	4.9	0.3
The teaching assistant was an effective instructor.	26	10	0	0	1	1	7	1	4.9	0.3

Question	%Favourable
The teaching assistant was well prepared.	89%
The teaching assistant was helpful.	89%
The teaching assistant was considerate of students.	89%
The teaching assistant was easily understood.	89%
The teaching assistant was an effective instructor.	89%

Comments
He was very passionate and knowledgeable about the topics covered, and his explanations were clear. He played a sort of leader role among the TAs, probably owing to his experience, which worked very well. His passion and interest caught on to me and I found myself looking forward to later labs and courses. Thank you very much for a great term!
I felt like Brandon was very well equipped to teach labs and the help and hints he gave were very useful to learning the subject
lots of great explanations and walked us through the answers.
Amazing TA, explains concepts in such an easy way its so easier to understand, always great to take doubts from him because I know I will get the best explanations TA like these make you love the subject.
He answered any questions very in-depth.

Explanatory Note

Percent Favourable Rating

This is the percentage of respondents who rated the instructor a 4 or 5 (Agree or Strongly Agree).

Interpolated Median

The data collected for Student Experience of Instruction (SEI) are ordinal in nature, with a natural order (from 1 to 5). While the mean may be used as a measure of central tendency for such data, it is not an appropriate or accurate representation of SEI data (cf. Stark & Freishtat, 2014). The usual measure of central tendency for ordinal data is the median. As a result, we have been reporting the mean and the median for the last several years. After considerable thought and data modeling, we now believe that the interpolated median is the best representation of the data, since it takes the frequency distribution into account.

Consider the following example from 2015W, the two course sections have identical mean (3.8). However, the instructor in section 2 received 77% favourable (4-5) ratings, compared to 53% for the instructor in section 1. The Interpolated median values of (3.7 and 4.2), much better reflects the distribution of the scores above and below their respective median. Furthermore, the interpolated median is better correlated with percent favourable rating; such that an interpolated median of 3.5 on a Likert scale of 1 to 5, corresponds to 50% favourable rating.

Frequency Distribution		
Response for University Module Item	Section 1	Section 2
5 = Strongly agree	5	5
4 = Agree	3	5
3 = Neither agree nor disagree	6	0
2 = Disagree	1	2
1 = Strongly disagree	0	1
Mean	3.8	3.8
Median	4.0	4.0

UBC Student Experience of Instruction

Interpolated Median	3.7	4.2
Percent favourable rating	53%	77%

Dispersion Index

The dispersion index is a measure of variability suitable for ordinal data (Rampichini, Grilli & Petrucci 2004). This dispersion index has values between zero and 1. A zero dispersion index indicates that all respondents in the section rated their experience of instruction the same. An index value of 1.0 is obtained when the respondents are split evenly between the two extreme values (Strongly Disagree & Strongly Agree), a very rare occurrence. In SEI data at UBC, the index rarely exceeds 0.85, and mostly for surveys not meeting the minimum recommended response rate.
